Features Key:

the game was designed to be played online (that means multiplayer)

the game was designed to be played very fast, therefore it doesn't require much power from your computer's hardware
the board is small and modular

Katharsis' graphics are of a typical 2D real-time RPG game, with graphics optimized for low-end hardware. Computer titles are a typical flat black and white vision with some effects added.

For the layout of the game, the Art Direction department worked on the following aspects:

- board and tiles's color - black and white
- card board (as board material) - white
- card and tile size - 14x14 mm
- tiles' size - 2x2 mm
- tiles' transparency - the transparency is standardized to 80%
- flavor for tiles - purely decorative (no flavor is represented in card board)

As for cell implementation, a sort of XY grid has been created.

2D art assets

Every board surface and tile has a different image. All the images representing character graphics were made by an **Vector graphics vectorizer** program called **Inkscape**.

The final assets have been created to fit a resolution of at least 640x480px on screen, because on computers with low resolutions, the machine cannot handle game sizes that do not fit in the screen.

3D art assets

In game, each military unit is represented by a 3D animated character model. For the graphic representation of the model, we used three different kinds of textures.

First textures are the ones assigned to 3D assets that will be displayed on screen. They represent a texture's color when seen on screen, and are the assets that will be rendered by the game.

Second textures are the ones assigned to 3D assets that will be

Having lost control of an asylum, the Warden closes the gates until he finds more to corrupt. Hellsinker is a basic injection rolled out for 5-6 ink. The ink is free, but there is a price to pay. The best case for converting to 3 ink from the gates of insanity is that all remaining abilities are worthless. If you are patient, you may

recover some value from your side. If you can ever convince the dude he needs to open the gates, 7 ink is a simpler task, as long as he clicks it every turn (see rule 1002).1. This mechanic is used when you pass an unpredictable event that does not affect you, and you are given the option to convert it.2. In this case, you can use the pool for an injection. The game gives you the best result - no other choice.3. The mechanic applies to all events. If you wish to convert all of them, assuming you have not spent an ink prior to the round, it might take 10 turns. In most cases when a dude lands in asylum, he has more options than he will ever explore.4. Each round should give you a range of good and bad results. In the case of a swing-jockey, the bad is early and the good is rarely. But if you are a late-game swinger-jockey, the bad is rarely and the good is early.5. Is this a threat of yours? Do you have early-game power? thesp_2012 Hellsinker. Having lost control of an asylum, the Warden closes the gates until he finds more to corrupt. This invention relates to an improvement in an engine fuel injection system, and more particularly, to a fuel injection system for diesel engines which senses the fuel pressure in the fuel rail and, in response, controls the amount of fuel injected into the engine. In a conventional diesel engine system, fuel is injected into the engine inlet manifold through a fuel metering system. Conventionally, the fuel metering system is not adjustable to compensate for changes in fuel pressure. As the fuel rail pressure decreases, the fuel flow through the engine diminishes and engine efficiency and performance are affected. It is an object of the present invention to provide a fuel injection system for diesel engines that can sense changes in fuel rail pressure, and can modify the injection timing of the fuel system to compensate for changes in fuel rail pressure. It is a further object of the present invention to provide a fuel injection system which is capable of switching between two or more injection patterns to accommodate a wide range of fuel rail pressures. It is a further object of the present invention to provide a fuel injection system which is capable of switching between two or more fuel injection patterns to improve or maintain engine performance and efficiency. These and other objects of the present invention are achieved by an injection system for injecting fuel into an internal combustion engine having an inlet manifold in communication with a fuel rail. The injection

system is adapted to inject fuel into the inlet manifold at a predetermined injection time. The fuel injection system includes at least one of a pressure sensing device and an electronic control unit connected to the fuel rail. The control unit is adapted to receive signals indicative of a level of fuel pressure in the fuel rail and a current value indicative of a current injection time. The control unit compares the fuel pressure level to a previously stored fuel pressure level and the current value to
